Neuromodulation

Application of energy, often electricity, to the body on purpose (to restore or enhance function)
What defines neuromodulation technologies is how energy is delivered to what target.

- Implants: Deep Brain Stimulation (DBS), Spinal Cord Stimulation (SCS)
- In-Hospital: Transcranial Magnetic Stimulation (TMS), Electroconvulsive Therapy
- Wearable: Transcranial Electrical Stimulation (tES), Transcranial Direct Current Stimulation (tDCS)
What defines neuromodulation technologies is how energy is delivered to what target.
tDCS: Transcranial Direct Current Stimulation

- Hand-held device, head gear
- 20 minute session, 2 mA via scalp electrodes
- Modulator of brain excitability and plasticity
- > 400 controlled trials across neurological / psychiatric inductions + performance
- Remote supervised (home)
- “tDCS for the treatment of depression did not show noninferiority to escitalopram”
- tDCS dose: 2 weeks daily tDCS, followed by 7 session once per week
- Drug dose: 10 mg daily escitalopram for the first 3 weeks, 20 mg per day thereafter.
International randomized-controlled trial of transcranial Direct Current Stimulation in depression
tDCS methods matters

1) Century of clinical testing, poor reproducibility:

tDCS: Transcranial Direct Current Stimulation

- Mixed clinical results
- Too many indications
- Too low intensity to trigger neuronal firing
- Direct current is not a physiologic signals
- Not spatially target
tDCS: Transcranial Direct Current Stimulation

• Mixed clinical results
• Too many indications
• Too low intensity to trigger neuronal firing
• Direct current is not a physiologic signals
• Not spatially target

High-intensity Pulses

Low-intensity DC

Over-driving a neural network

Neuromodulation comes from secondary non-linear changes

Deep Brain Stimulation  Motor Cortex Stimulation  Transcranial Magnetic Stimulation (TMS)
High-intensity Pulses

Low-intensity DC

Over-driving a neural network
Over-driving a neural network

High-intensity Pulses  Low-intensity DC
High-intensity Pulses

Over-driving a neural network

Low-intensity DC

Interacting with specific activity in a neural network (Neuromodulation)
Network of interest (e.g. depression, math cells)Other networks – not targets for neuromodulation

Preferential modulation of more active network (activity dependent)

Current flow across entire brain region

Electrode
Functional Targeting:
Activity dependent sensitivity to brain stimulation
Theta Burst Stimulation (TBS) generates LTP which is modulated by concurrent Direct Current Stimulation (DCS).
Theta Burst Stimulation (TBS) generates LTP which is modulated by concurrent Direct Current Stimulation (DCS)

1 hour after TBS

- DCS does generate synaptic plasticity de novo (Activity Dependent)
- Directions of changes by anodal/cathodal depends on LTP types
Repeated DCS accelerates LTP and boosts the ceiling for synaptic learning

- Hypothesis: Combining DCS with ongoing training enhances the rate and ceiling learning specifically of that task (Activity Dependent)
tDCS applied with a task. Specificity comes from the task. tDCS makes the task (therapy) more effective
Novel cellular targets of tDCS support Functional Targeting Coupled Neuro-Vascular Hypothesis of Neuromodulation

4) Neuro-vascular Coupling: Cancel et al. Direct current stimulation of endothelial monolayers induces increase in transport due to the electroosmotic effect. Nature Sci Reports. 2018
tDCS: Transcranial Direct Current Stimulation

- Mixed clinical results
- Too many indications

Software allows you to steer currents to targeted brain regions

- Single programmable device and head-gear
- Target optimized solved. Question is what target?
EEG automatically and instantly “inverted” to optimal HD-tDCS montage

- Decades old “reciprocity” hypothesis, but with closed head model
- Activity guided targeting, does not require source localization
Phase II (Harvard/Spaulding) Fibromyalgia pain
Daily in-clinic sessions of EEG Guided HD-tDCS, open label
